

Model View Controller and Wire Framing

Here is a complete list of **short and descriptive questions with their answers** based on the content of the slide titled "**Model View Controller and Wire Framing**":

Short Questions with Answers

1. What does MVC stand for?

Answer:

MVC stands for **Model-View-Controller**, a design pattern used for developing user interfaces by separating concerns into three interconnected components.

2. What is the purpose of using MVC architecture?

Answer:

The main purpose of MVC is to **separate the user interface from business logic**, making applications easier to develop, test, and maintain.

3. What is the role of the Model in MVC?

Answer:

The **Model** represents the **data and business logic** of the application. It notifies the View when data changes occur.

4. What is the role of the View in MVC?

Answer:

The **View** is responsible for **displaying data to the user**. It receives data from the Model and renders the user interface.

5. What is the role of the Controller in MVC?

Answer:

The **Controller** handles **user input and events**. It interprets actions (like button clicks) and updates the Model or View accordingly.

6. What is wireframing in UI/UX design?

Answer:

Wireframing is a technique used to create a **low-fidelity visual representation of a user interface layout**. It focuses on structure, layout, and content placement, not on colors or graphics.

7. Why is wireframing important?

Answer:

Wireframing is important because it:

- Helps **visualize the layout** early.
 - Encourages **feedback and iteration**.
 - Saves time and effort during development.
-

Descriptive Questions with Answers

1. Explain the MVC architecture with its components.

Answer:

The **Model-View-Controller (MVC)** architecture divides an application into three parts:

- **Model:** Handles the core data and business logic. It is responsible for managing the application's state and updating the data.
- **View:** Displays the model's data to the user. It presents the information in a specific format (UI).
- **Controller:** Acts as an intermediary between Model and View. It processes user input and determines what to do with it, often modifying the Model or updating the View.

✅ Benefits of MVC:

- Promotes **separation of concerns**.
- Improves **code reusability** and **scalability**.

- Easier to **test** and **maintain** applications.
-

2. What is wireframing and how is it used in UI design?

Answer:

Wireframing is the process of creating a **simple visual guide** that outlines the structure and layout of a web page or app screen. It focuses on:

- **Placement of elements** like headers, buttons, menus, and content areas.
- The **functionality and flow** of the interface without design elements (no colors, images, or styles).

 **Uses of Wireframing:**

- Planning user journeys.
- Communicating ideas with stakeholders.
- Testing usability and layout before design.

 Tools for wireframing include: **Balsamiq, Figma, Adobe XD, Sketch.**
